Abstract ID	Score	Title	Newsworthy	Final Recommendation	Final Comments	Additional Comments
426517	38.00	Disparities related to exposure to adverse childhood experiences by race and ethnicity in a national survey sample: A latent class analysis		I recommend this abstract be accepted with the some changes (use the Final Recommendation Comments box below)	This abstract needs to provide more info: 1. what are the social determinants of health this study is assessing? 2. what are the nine ACE indicators? The validity/reasoning of the cut-off points for the three categories	This paper/abstract should also address limitations of survey on ACE. In addition, the confidence intervals should also be included along with the p values.
437792	32.00	Leveraging EMR Body Mass Index (BMI) for population-based surveillance in El Paso, Texas		I recommend this abstract be accepted as a Poster	This abstract presents a new way of mapping obesity prevalence in El Paso, Texas by geocoding obesity status from EMRs, which would yield to a more accurate analysis on prevalence. However, this abstract did not point out what the risk factors are or how these risk factors are different in Texas as compared to other cities/counties/states? The sampling method of pulling adult patient records from these two health center and clinic would potentially have selection bias. The abstract or the paper should give more details about how this sample can represent the whole population in El Paso, Texas.	The conclusion did not address how or why nationally estimated obesity prevalence for El Paso differs from census tract averages in the EMR. I would recommend to accept it as a poster.
